

OWNER INPUT + RESEARCH RECONCILIATION

Where the Earlier Research Fits Dilene's Real App

A practical placement map: four places the prior work belongs, what is still missing, and what should stay out of the first release.

PREPARED FOR	Dilene Allen and Q
AS OF	September 13, 2026
STATUS	Working analysis - not an owner decision

Bottom line: the old work is not wasted. It becomes the branded listing shell, the operator publishing system, a premium spatial-data layer, and the evidence-based roadmap for pricing and marketplace features. Only the first two are required to ship Dilene's requested first version.

The answer in one page

Dilene's request is narrower and more operational than the earlier concept work: a branded page for each Matterport tour, lead capture, a private inquiry area, a fast no-code listing workflow for Q, and a scan-request flow that only estimates after real pricing is approved. The existing custom walkthrough remains a separate premium track.

FOUR LANDING ZONES

1. Public listing experience: brand, tour-page UX, property data, compliance and lead capture. **2. Operator system:** repeatable listing intake, validation, publish status and inquiry handling. **3. Premium spatial layer:** the owned Three.js walkthrough, floor plan and SpaceGraph fit/access tools. **4. Service and growth layer:** scan-request intake now; pricing intelligence and marketplace lessons later.

WHAT SHIPS FIRST

- One real mobile-first listing page with a quiet Matterport embed, approved property facts, agent context and a lead form.
- A private owner/operator inbox where the submission arrives with listing context and an assignable status.
- A repeatable Q workflow that creates and publishes the next listing without editing application code.
- A scan-request form that collects facts and routes to a custom quote until Dilene and Q approve actual pricing rules.

THE AUTHORITY RULE

Dilene's original notes are owner requirements. The pasted Claude analysis is a useful interpretation and reality check, not an owner decision. Repository research is evidence and reusable design work. When they conflict, the owner notes set priority and the conflict stays visible until Dilene and Q decide.

CONFLICT ALREADY FOUND

The older *site-spec.md* called lead-capture funnels a Milestone 2 non-goal. Dilene's later owner notes explicitly require lead capture on every tour page and a private inquiry area. The later owner requirement supersedes that older non-goal; the canon should be revised after owner approval.

Timing key

NOW	NEXT	LATER / GATED
Required for the requested first release	Adds differentiation after the core workflow works	Requires demand, owner decisions or legal/operational maturity

Four places the prior research belongs

The first two are product requirements. The last two are controlled extensions, not reasons to delay launch.

01

NOW

The public per-listing tour page

WHERE IT LANDS

The shareable page an agent sends instead of a raw Matterport URL: tour first, verified facts, agent card, share controls, privacy/compliance copy and a short inquiry/showing form.

RESEARCH THAT TRANSFERS

The established black/bone/champagne visual system; *brand.json*; mobile and quiet-interface principles; the Docent's non-blocking guidance; the reusable property JSON idea; TREC labeling research; Matterport embed notes; and the old rule that the property, not the interface, is the hero.

WHAT THE APP GAINS

A specific, credible listing experience that preserves Dilene's identity, captures a lead with listing context, and can later host either a Matterport embed or an owned tour without changing the public link.

BOUNDARY

Use a normal Matterport embed first. Do not make SDK/API access, automated model import, or the custom Three.js engine a launch dependency. No listing fact or compliance claim may be invented.

02

NOW

Q's listing-to-inbox operating system

WHERE IT LANDS

A guided listing intake and publish flow plus the private Inquiries, Scan Requests and Tours views. Q can add a completed listing, attach the Matterport link, verify facts, publish/unpublish it and track follow-up without touching code.

RESEARCH THAT TRANSFERS

The capture protocol's repeatable artifact/naming discipline; schema-validated property data; the plan-render workflow's 'validate before publish' pattern; the Mantis report queue's recoverable delivery and status ideas; and the Chat Sites research showing that one shared brief/data contract can drive both prototypes and the owned application.

WHAT THE APP GAINS

The app becomes an operating tool, not just a beautiful page. Every lead is tied to a property and responsible person; every listing has a visible draft/published/archived state; the next listing is repeatable.

BOUNDARY

The old phone-photo capture checklist is not Q's production input if the son already scans and uploads to Matterport. Keep its QA and naming logic, but redesign the workflow around what Q actually receives after Matterport processing.

Four places the prior research belongs

03

NEXT

The premium owned-tour and agent-ready layer

WHERE IT LANDS

An optional enhancement on selected listings: the existing scroll-driven Three.js walkthrough, generated ink-and-wash floor plan, and SpaceGraph answers such as room dimensions, adjacency, furniture fit and access paths.

RESEARCH THAT TRANSFERS

The working Vite/TypeScript/Three.js engine; *floorplan.json* schema; plan renderer; capture/drafting standards; panorama graph research; and the tested SpaceGraph spike with 43 assertions and channel-independent tool definitions.

WHAT THE APP GAINS

A defensible upsell: not merely 'another 3D tour,' but an owned spatial artifact that can answer practical buyer questions. The same normalized property data can serve the walkthrough, floor plan, on-page tools, hosted MCP and structured markup.

BOUNDARY

Keep this separable from the Matterport Phase 1 path. Validate extraction accuracy and buyer/agent demand before promising fit or access answers. Measurement tolerance and known geometry gaps must appear with every answer.

04

LATER / GATED

The scan-request, pricing and marketplace roadmap

WHERE IT LANDS

Immediately, the research shapes a smart scan-request form and owner-controlled quote routing. Later, it can support manual DFW benchmark ranges, operator profiles/portfolios, scheduling and eventually multi-operator marketplace capabilities.

RESEARCH THAT TRANSFERS

The Claude reality checks on supply, local trust and price transparency; hosting/vendor cost work; staged maturity tiers; the distinction between plain embeds and plan-gated developer tools; and the earlier finding that operations/support, not storage, becomes the scaling cost.

WHAT THE APP GAINS

Pricing intelligence starts honestly as approved rules and observed jobs, not fake analytics. Marketplace research becomes a gate checklist: demand, operator supply, payouts, permissions, support and compliance must exist before software expands.

BOUNDARY

Do not build Stripe Connect, operator reviews, messaging, disputes, agent payments, WebMCP commerce or automated pricing for the first release. Exact Matterport access/pricing claims in chat are time-sensitive and must be verified in the actual account.

What is still missing

The research is rich on architecture and possibility. The gaps are mostly owner facts, real production inputs and the operational decisions that turn a prototype into a business system.

GAP	WHAT MUST BE SUPPLIED OR PROVED
Owner decisions	Public service name; domain/subdomain; real scan prices and add-ons; service ZIP codes; rush rules; promised turnaround; who besides Dilene and Q can enter the private area; who owns leads for another agent's listing; how long completed Matterport spaces remain active.
First real listing	One approved Matterport share URL/model, cover image, property facts, listing-agent details, share-preview copy and permission to publish. Missing optional facts should disappear, not be filled with examples.
Matterport reality	Exact camera model, account owner, current plan, active-space limits, embed permissions, available Developer Tools and whether the son can provide exports. A screenshot of Billing and Developer Tools is stronger than a pricing table copied from chat.
Lead operations	Required form fields, consent/privacy wording, notification recipients, response expectation, lead statuses, reassignment rules, duplicate/spam handling, retention/deletion policy, CSV needs and a failure path when email delivery fails.
Q's workflow	A recorded dry run from 'scan processed' to 'link sent to agent': what files/links Q receives, which facts he verifies, who approves, how corrections work, when a tour is unpublished and what should happen when Matterport access expires.
Production platform	Approved database/auth/email choices; server-side validation; rate limits and bot controls; backups; audit trail; analytics events; accessibility/mobile acceptance; domain/DNS access; spend alerts. Provider selection should follow provisioning, not precede it.
Compliance	Dilene's completed IABS link, Consumer Protection Notice link verification, Texas brokerage/advertising review, and rules for displaying any listing that is not hers. These remain owner/legal TBDs, not AI copywriting tasks.
Evidence for growth	Before marketplace work: named operators willing to participate, five or more structured interviews, observed jobs and prices, support expectations, and a clear answer to why clients choose this service over Matterport's or other local options.

MOST IMPORTANT MISSING ARTIFACT

A real listing packet and a witnessed Q dry run. Together they reveal the actual data model, the true publishing steps and the mistakes the interface must prevent. More market research cannot substitute for that operational evidence.

What is not relevant to the first release

'Not relevant' here means park it so it cannot delay the requested product. Several items may become valuable after the tour-to-lead-to-follow-up loop works with real listings.

RESEARCH	DISPOSITION	WHY
Build a phone-only 360 capture and stitching pipeline	PARK	They already scan, process and host in Matterport. Revisit only if vendor independence or a lower-cost service tier becomes a chosen product.
Camera shopping and no-LiDAR capture assumptions	PARK	The operating reality has changed: the son is the camera operator and the family already has a LiDAR workflow. Retain only capture QA and naming principles.
Cesium bay-window-to-DFW zoom-out	PARK	A memorable premium visual, but it does not improve the first tour page's lead or publishing workflow and introduces cost/terms/coordinate work.
AI camera-move prompts, exterior clips and virtual staging	PARK	Marketing production research, not application infrastructure. Use only for a chosen premium media deliverable with disclosure and approved rights.
Own 360 hosting and detailed egress models	LATER	Useful only if Dilene and Q decide to host assets rather than embed Matterport. Today Matterport carries those bytes and retention is the relevant question.
WebMCP browser adoption and payment protocols	LATER	The SpaceGraph abstraction is useful now; experimental browser delivery, x402/MPP metering and agent commerce are not part of Dilene's requested first workflow.
Two-sided marketplace plumbing	GATED	Operator onboarding, payouts, reviews, disputes and messaging are a different business stage. Require named supply, recurring demand and an owner-approved legal/operations model.
Exact plan and API price tables copied from chat	RECHECK	Treat as leads for verification, not requirements. Entitlements, licensing and prices change; the actual Matterport account screen and current official terms govern.
ChatGPT Sites as the production platform	PROTOTYPE ONLY	Its brief/design method transfers. The owned repository remains the production home; auth, data portability and plan-gated beta features make Sites a sketchpad only.

RESEARCH TO PRESERVE, EVEN WHEN PARKED

Do not delete the parked work. Label it by trigger: 'use when Matterport independence is approved,' 'use when a premium listing is sold,' or 'use after marketplace demand is proven.' This keeps valuable research findable without letting it act like a current requirement.

Recommended decision path

1 Approve the Phase 1 contract

Dilene and Q confirm the four first-release surfaces: home/service page, per-listing tour page, scan request, and private operations area. Confirm that the owned walkthrough is a premium track, not a prerequisite.

2 Run one real listing through Q

Collect the real Matterport link, facts, cover, agent routing and expiration/retention information. Observe Q's steps. Convert those steps into the listing form and publish states.

3 Close owner and compliance TBDs

Supply business name/domain, prices/service area, lead ownership, authorized users, privacy/retention language, completed IABS and required brokerage review.

4 Build and verify the closed loop

A phone visitor opens the tour, submits a real inquiry, Dilene/Q receives it with listing context, assigns a status, and Q publishes the next listing without code.

5 Choose the first differentiator using evidence

After the loop works, test one premium addition: the owned walkthrough/floor plan or a SpaceGraph answer. Measure whether agents and buyers actually use it before expanding the catalog.

6 Earn pricing intelligence and marketplace scope

Start with owner-approved estimate rules and logged jobs. Only after real volume and named operator supply should the app add benchmark analytics, operator accounts, scheduling or payouts.

DEFINITION OF THE FIRST PROOF

A real person can receive a listing link, experience the tour on a phone, submit an inquiry, and have Dilene or Q see, own and update that inquiry. Q can then publish a second listing without developer help. That proof matters more than any marketplace feature count.

Source record and confidence

This report compares local project material only. It does not promote inbox artifacts into canon and it does not treat vendor pricing or access claims in chat as verified current facts.

ROLE	SOURCE	HOW USED
Owner authority	_INBOX D/For Dilene and Q/HER NOTES - Owner Requirements.md	Controls priority and acceptance.
Current product synthesis	_INBOX D/For Dilene and Q/Dilene Real App - Working Definition.md	Useful working definition; recommendations remain recommendations.
Captured Claude analysis	User attachment: pasted-text.txt	Preserved interpretation and reality checks; not owner approval and not independently fact-checked here.
Tour-page handoff research	_INBOX D/Notes from Claude Ext on Chat Sites and related Tour Pages artifacts	Supports brief/design contracts, prototype lessons and operator flow.
Existing app canon	docs/site-spec.md, offerings.md, capture-protocol.md, floorplan-schema.md, stack-and-keys.md, vendor-notes.md	Defines the owned walkthrough, data model, capture and prior architecture; some older scope conflicts need reconciliation.
Spatial research	_INBOX D/Agent-Ready-Listings.pdf and SpaceGraph - agent-callable tools over floorplan_json	Supports the premium spatial layer; the latter records a tested Phase 0 spike.
Provenance	_archive/2026-09-source/README.md and extracted artifacts	Shows where older claims came from and which work is archived rather than canon.

Confidence notes

- High confidence: the four placement areas follow directly from owner requirements and working repository assets.
- High confidence: lead capture and Q's no-code publishing workflow are first-release needs.
- Medium confidence: the premium SpaceGraph layer is differentiated; customer value still needs direct validation.
- Low until verified: exact Matterport plan entitlements, developer licensing, API access and prices quoted in chat.
- Owner decision required: anything involving pricing, service promises, lead ownership, legal/compliance language or marketplace timing.

Prepared as a decision aid. Recommendations and timing labels are analysis, not statements attributed to Dilene or Q.
